```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUMMARIES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       141180

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTS1 cDNA 700747. The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and sequence 947 BP; 207 A; 271 C; 273 G; 196 T;

mutation(s) and their treatment
Disclosure; Column 89-90; 72pp; English.

This DNA sequence encodes a variant of the human multiple tumour suppression protein, MTSI. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21.

Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, pliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum.
                                                                                                                                                                                                                                                                                                                                             Villo-1998 (first entry)

Claim 1: Fig 17, Tapp; English.

This is the nucleotide sequence of the invention. The MTS gene

Compared to the method of the invention. The MTS gene

Compared to the diagnosis and prognosis of human cancer, e.g. by

Compared sequences are those that are present in somatic mutations

Compared sequences are those that are present in somatic mutations

Compared sequences are those that are present in some therapy

Compared sequences are those that are present in patients. These

Compared sequences are those that are present in patients. These

Compared sequences are those that are present in patients. These

Compared sequences are those that are present in patients. These

Compared sequences are those that are present in patients. These

Compared sequences are the construct protein mimetics, also for therapeutic

Compared sequences are the sequence and the protein are the protein and the protein are the sequence of the sequenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the cDNA sequence for a human multiple tumour suppressor 1 (WTS1) gene, including noncoding portions. The gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanona, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.

The proposed transformation of a cell and developing inhibitors and detection of subunit components of cyclin complexes - used for diagnosing transformation of a cell and developing inhibitors and activators, partic for cancer treatment

Claim 15; Page 39-40; 45pp; English.

The cell cycle gene implicated most strongly in oncogenesis is the human cyclin Di. It is genetically linked to the bcl-1 oncogene, a locus activated by translocation to an immunoglobulin gene enhancer. In some B-cell lymphomas and leukaemias. D-type cyclin, cyclin of polypeptide) exist in a quaternary complex that many combinatorial variations of the components e.g. cyclin Di or D3 and combinatorial variations of the components e.g. cyclin Di or D3 and combinatorial variations of the components e.g. cyclin Di or D3 and complexes. In virally transformation by DNA tumour viruses such as SV40 is associated with selective subunit rearrangement of the cyclin D complexes. In virally transformed cells, CDK4 totally dissociates from cyclin, PCNA and p21 and becomes associated with a 16 kilodalton polypeptide (p16). This nucleotide sequence encodes a 16 kba protein, designated p161NK4 which binds to and inhibits CDK4. This polypeptide was discovered to show many similarities to p16.

Reagents, such as monoclonal antibodies, can be developed that recognise the interactions between the CDK's cyclins, PCNA and low molecular weight proposed to identify the state of transformation of a cell in the relation of a cell in the state of transformation of a cell in the ce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     230

The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid cancers, etc. sequence 1131 BP; 232 A; 327 C; 343 G; 229 T;

Claim 4; Page 100-101; 156pp; English.

Craim 501peptides have been isolated asequenced. This sequence encodes polypeptides have been isolated (R80947). MTS polypeptide-encoding converse of the MTS polypeptide with the diagnosis or prognosis of human cancer. Germ-line mutations of MTS cohas can be used for human cancer. Germ-line mutations of MTS cohas can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also creming for potential cancer therape may also be used for protein replacement therapy. Also screening for potential cancer therape may 327 C; 343 G; 229 T;

Disclosure; Columns 73-74; 72pp; English.
The present sequence the human multiple tumour suppressor gene (MTS1) Elbeta, useful in cancer diagnosis.
Sequence 1131 Bp; 232 A; 327 C; 343 G; 229 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

     mutation(s) and their treatment.
Claim 1; Fig 12; 72pp; English.
This coNA sequence encodes a human multiple tumour suppression protein,
MTSIE1-beta. The MTS gene locus; located on human chromosome 9p21. Germ line
matations in MTS genes can be used in the diagnosis of predisposition to
ancers, e.g. melanoma, Leuksemia, astrocytoma, gliboblastoma, lymphoma,
glioma, Hodokin's lympho, leuksemia, storocytoma, gliboblastoma, lymphoma,
thyroid, ovary, uterus, testis, kidney, stomach and rectum.

Example 7: Column 73-76; 73pp; English.

This is the nucleotide sequence of the multiple tumour suppressor

(MTSIEIS) gene, used in the method of the invention. The MTS gene
(MTSIEIS) gene, used in the method of the invention. The MTS gene
(Standard nucleic hybridisation techniques, of patient samples.)

The mutated sequences are those that are present in somatic mutations

of the gene in cancers. The vectors can be used for gene therapy

strategies to replace function of mutated protein in patients. These

can also be used to construct protein minetics, also for therapeutic

strategies. In addition the expression constructs can also be used

for recombinant production of MTS. Recombinant MTS can be used to

screen for drugs to be used for cancer therapy, and the protein

careen for drugs to be used for cancer therapy, and the protein

screen for drugs to be used for cancer therapy, and the protein

screen for drugs to be used for cancer therapy, and cell.

The present sequence encodes a human multiple tumour suppressor IEI-beta (MTSIEI-beta) protein. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast,

CDK inhibitory fusion protein coding sequence #1.

CDK inhibitory fusion protein coding sequence #1.

Fusion gene; CDK inhibitor; cyclin-dependant kinase; p27 gene; p16 chimaric polypeptide; human; binding motif; proliferation control; cell differentiation; cell-cycle inhibitor; proliferative disorder; Homo sapiens.
                                                                                                                                                                                                                                                                   /*tag= b

This sequence encodes a chimmeric polypeptide of the invention. It was derived from a fusion of the human p27 and p16 cDNA sequences. The chimmeric polypeptides of the invention have cyclin-dependent Kinase (CDK) binding motifs from at least two different proteins that bind to CDKS. The protein controls proliferation and/or differentiation of cDKS. The protein controls proliferation and/or differentiation of cells, particularly they inhibit cell-cycle progression. They can be used to treat a wide range of proliferative disorders, e.g. cancer, leukaemia, psoriasis, atherosclerosis, restenosis, chronic inflammation etc. They can also treat diseases associated with de-differentiation of control can also treat diseases associated with de-differentiation of control con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
